The Project

DEBT is a minimalist BEP-20 token with a fixed supply of 360,000,000. No roadmap, no promises, no mechanics pretending to create value. It doesn't represent success or escape, it reflects the cycle.

Bills, expenses, income that doesn't keep up, stress, repeat. DEBT doesn't fix anything. It just exists where you already are.

The Reality

You check your balance before your messages, you delay what you need, you justify what you don't. You tell yourself it's temporary, you tell yourself you're getting ahead, but most days feel the same. Work, pay, recover, repeat. Nothing improves, it just keeps going.

The Philosophy

DEBT is intentionally simple. No reflections, no automatic rewards, no complex tax logic, nothing hidden, and nothing engineered because the system it reflects isn't complicated either.

- **Fixed Supply:** 360,000,000 tokens. Representing a full cycle.
- **Simplicity:** Standard BEP-20 behavior; no embedded tax or reward mechanics.
- **Fairness Mindset:** Temporary launch limits (1% of the supply per buys/sells and 2% of the supply per wallet) is used to discourage early whales and holder concentration. Ownership is intended to be renounced once trading is underway.

Why People Hold It

Some hold DEBT because it's real, some for the meme. Owning DEBT doesn't mean you're out of the cycle. It means you see it.

Disclaimer

DEBT is a meme/community token. It carries market risk and may go to zero. Nothing herein is financial advice. DEBT makes no claims of utility, value, or outcome. It is not affiliated with any financial institution, lender, or governing body. Always do your own research.

Token Specs

Name: Deb T
Ticker: DEBT
Cashtag: $DEBT
Supply: 360,000,000
Decimals: 18
Blockchain: BNB Smart Chain
Contract Address: 0xA0F81811554C6CdDf244D943236377862485f18f

Deployment & One-Time Set-Up

1. Deb T was deployed from DEBT.sol with 200 runs.

2. One trading pair (DEBT / WBNB) was created manually using the Factory.

    ○ 0x226414494f8D36c3c743511a0903eDB0A1fBd9eB

3. The trading pair was set as the original pair in the contract so that trades could be tracked in order to enforce the temporary 1% buy and sell limits.

4. Liquidity was added manually on PancakeSwap (83% of the DEBT supply trades against US$20.01 in BNB at the time of launch).

    ○ 298,800,000 DEBT / 0.03066 BNB

5. The liquidity pool (LP) tokens were sent to the dead wallet, making the token unruggable by the owner/deployer.

    Transaction Hash:
    0xf2febf3e0350ecc3ee59dc9d8128ac39ed8c4d9480db67586271610352ab5a4b

6. 17% of the total supply was retained by the deployer. These tokens are not locked and may be sold or transferred.

Token Functions

Minimal BEP-20 Interface (Used for rescue calls.)

- balanceOf(account)
- transfer(to, amount)

Additional Functions

- allowance(owner, spender)
- approve(spender, amount)
- balanceOf(account)
- decreaseAllowance(spender, subtractedValue)
- increaseAllowance(spender, addedValue)
- transfer(to, amount)
- transferFrom(from, to, amount)

Owner Address

- Stored in owner; set to the deployer on deployment.

Modifiers

- noDoubleDipping → general reentrancy lock.
  onlyOwner → owner only + reentrancy lock.

Launch Restrictions

- **Buy / Sell Limit:** 1% of the total supply (applies to all recipients; owner is not exempt).
- **Wallet Limit:** 2% of total supply (applies to the recipient; exempt if recipient is the owner or the set trading pair).

Owner Actions

- liftRestrictionsAndRenounce() → disables limits and sets the owner address to the zero address in one call.
  setOriginalTradingPair(address) → can be set once only.

Trading Pair

- originalTradingPair (For buy and sell detection to enforce temporary limits.)

Harmless Fun

- advice (Gives free valuable advice on debt.)

Stuck Assets

- claimStuckBNB(to) → sends the entire BNB balance to the caller.
- claimStuckTokens(token, to) → sends the entire balance of the selected token to the caller.

BNB & Fallback Handling

- **Fallback**
  - fallback() → handles unknown calls.
- **Receive**
  - receive() → handles incoming BNB.

Emitted Events

- **Approval**
  Fires when allowances are set/changed (approve, increaseAllowance, decreaseAllowance).
- **FallbackCalled**
  Fires when the contract's fallback() is hit (unknown function selector), with any attached BNB and/or calldata.
- **OriginalTradingPairSet**
  Fires once when the owner sets the initial DEX pair used to apply the launch limits.
- **ReceivedBNB**
  Fires when the contract's receive() function gets BNB (direct native transfers).
- **RestrictionsLiftedAndOwnershipRenounced**
  Fires when liftRestrictionsAndRenounce() is called. In that tx, limitsActive is set to false and owner is set to address(0) (renounced).
- **StuckBNBClaimed**
  Fires when claimStuckBNB(to) successfully forwards the contract's BNB balance.
- **StuckTokensClaimed**
  Fires when claimStuckTokens(token, to) successfully rescues non-BLUCAR tokens held by the contract.
- **Transfer**
  Fires on every successful token transfer (wallet→wallet, transfer, transferFrom, buys/sells via the pair after limits).

AI Representative

DEBT is represented by AI Model Deb T across 360 memes on social media.

Logos in Night and Day

Roadmap

- Plan Deb T project.
- Code and deploy the token to the BNB Smart Chain.
- Compose a simple white paper.
- Set up social media accounts.
- Create a website.
- Create memes and post them.
- Renounce ownership once trading is underway.
- Get listed on CoinMarketCap.
- Leave DEBT to circulate freely.

The Team

There is no team, only a deployer who will oversee the launch and then renounce ownership once trading is underway. No minting, burning or rug pulls are possible during this process.
